The MD-7.5 belongs to the family of the Knelson™ batch concentrators known worldwide for gold recovery, fine gold recovery and recovery of other precious metals.

Primarily used in the processing of gold bearing samples, the KC-MD7.5 concentrator has also been successfully applied in heavy mineral research studies, environmental waste-treatment projects, small-scale production mining and as a means of significantly upgrading low-grade gold concentrates.

Equally suitable for field-testing of alluvial gravel or for in-mill stream sampling, the KC-MD7.5 concentrator produces results that can be accurately "scaled-up" to project production scale results.
